contrast to specimens, and other technology associated with the methods of optical microscopy, have improved significantly over the past 20 years.

The growth and refinement of the confocal approach is a direct result of a renaissance in optical microscopy that has been fueled largely by advancements in modern technology.

In microbiology, streaking is a technique used to isolate a pure strain from a single species of microorganism, often bacteria. The dilution or isolation by streaking method was first developed by Loeffler and Gaffky in Koch's laboratory, which involves the dilution of bacteria by systematically streaking them over
