About Us Natural Life

Life span is a measure of the actual length of an individual's life. While both terms seem straightforward, a lack of historical artifacts and records have made it challenging for researchers to determine how life spans have evolved throughout history.

Life Span and Life Expectancy From Prehistory to Today

From The Natural History of German Life† * * * * * The greatest benefit we owe to the artist, whether painter, poet, or novelist, is the extension of our sympathies. Appeals founded on generalizations and statistics require a sympathy ready-made, a moral sentiment already in activity; but a picture of human life such as a great artist can give,

Natural History Books - Goodreads

Crocodile - Crocodile - Natural history:
The young crocodile emerges from the
egg with a length of 20-30 cm (8-12
inches). At first it remains with its
siblings concealed at the edge of its
water habitat in order to avoid various
predators. Principal among these are
fishes and birds, but larger crocodiles
also prey upon the young.

Crocodile - Natural history | Britannica

The four life stages are the egg, larva,
pupa, and adult. Pearly white oval eggs
are deposited on the body of, or in the
nest or habitat of, the host animal. The
larva is small and legless and feeds on
organic debris, such as dried excrement,
dried bits of skin, dead mites, or dried
blood found in the host's nest.
